

amFireStations

Apogee Mapping is pleased to introduce a new spatial dataset, amFireStations. Comprised of more than 46,000 fire department and station locations across the United States, amFireStations is the most comprehensive spatial dataset depicting fire and emergency response facilities – both career and volunteer - currently on the market.

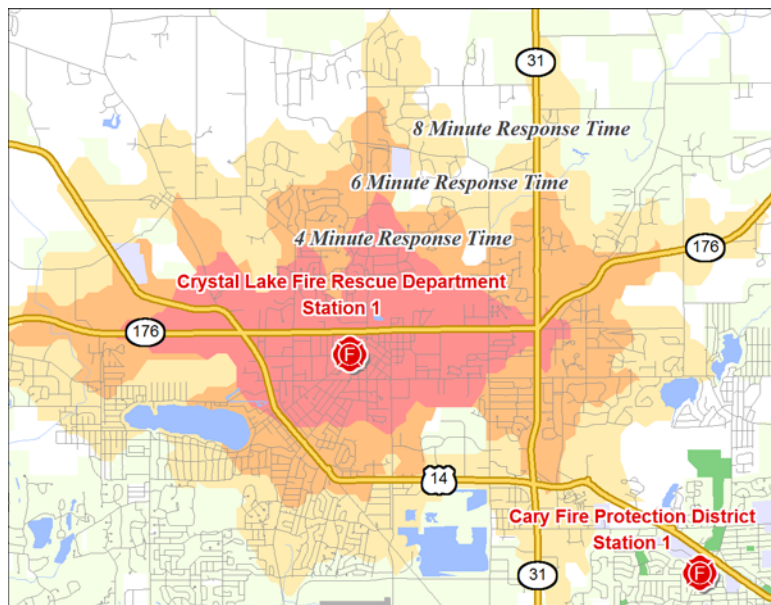

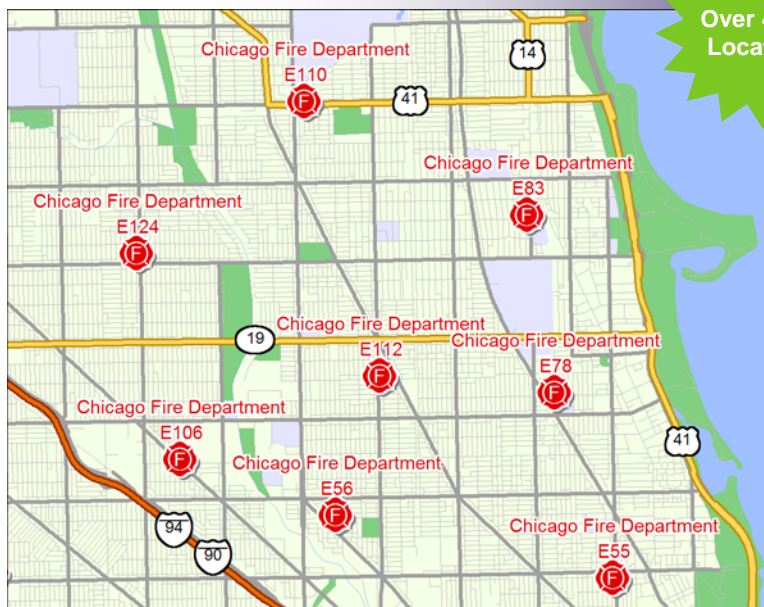

Insurance underwriters will find this dataset invaluable when it comes to determining proximity of emergency services to new and existing policyholders as well as establishing appropriate rates based on response times and other criteria.

amFireStations is also a valuable resource for Emergency Preparedness entities and serves as a helpful tool for coordinating first responders and government agencies throughout local and regional communities in the event of a natural disaster or other large-scale emergency.

amFireStations can even assist with site selection analyses and is a must-have dataset for commercial real estate firms, retailers and service providers that need to make recurring location-based decisions in support of growing and streamlining businesses, and assisting clients.

If you think your organization could benefit by having amFireStations as a data resource, please call Apogee Mapping today to learn more.

Over 46,000 Locations!

amFireStations includes location information as well as department and station names for facilities across the United States, including Alaska and Hawaii.

Above: a standard station location map.

Left: a response time map for an established station. Such a map can be used to determine underserved communities, assist with the site selection process for new stations, and help insurance agencies establish policy rates based on availability of emergency resources in a given community.
